CHAPTER 1

Foundations

Basic Category Theory

Categories. We use the first order theory of Neumann-Bernays-Gödel (BNG) as described in [Men15, p. 231].

Definition 1.1 (Category). A category & consists of

- A class ob(\mathcal{C}), called the **objects of** \mathcal{C} .
- A class $mor(\mathcal{C})$, called the morphisms of \mathcal{C} .
- Two functions dom: $mor(\mathcal{C}) \to ob(\mathcal{C})$ and $cod: mor(\mathcal{C}) \to ob(\mathcal{C})$, which assign to each morphism f in \mathcal{C} its **domain** and **codomain**, respectively.
- For each $X \in ob(\mathcal{C})$ a function $ob(\mathcal{C}) \to mor(\mathcal{C})$ which assigns a morphism id_X such that $dom id_X = cod id_X = X$.
- A function

$$\circ : \{ (g, f) \in \operatorname{mor}(\mathcal{C}) \times \operatorname{mor}(\mathcal{C}) : \operatorname{dom} g = \operatorname{cod} f \} \to \operatorname{mor}(\mathcal{C})$$
 (1)

mapping (g, f) to $g \circ f$, called **composition**, such that $dom(g \circ f) = dom f$ and $cod(g \circ f) = cod g$.

Subject to the following axioms:

• (Associativity Axiom) For all $f, g, h \in mor(\mathcal{C})$ with dom h = cod g and dom g = cod f, we have that

$$(h \circ g) \circ f = h \circ (g \circ f). \tag{2}$$

• (Unit Axiom) For all $f \in mor(\mathcal{C})$ with dom f = X and cod f = Y we have that

$$f = f \circ id_X = id_Y \circ f. \tag{3}$$

Remark 1.1. Let \mathcal{C} be a category. For $X, Y \in ob(\mathcal{C})$ we will abreviate

$$\mathcal{C}(X,Y) := \{ f \in \text{mor}(\mathcal{C}) : \text{dom } f = X \text{ and } \text{cod } f = Y \}.$$

Moreover, $f \in \mathcal{C}(X, Y)$ is depicted as

$$f: X \to Y.$$
 (4)

Example 1.1. Let * be a single, not nearer specified object. Consider as morphisms the class of all cardinal numbers and as composition cardinal addition. By [Hal12, pp. 112–113], cardinal addition is associative and \varnothing serves for the identity id_{*}.

Definition 1.2 (Locally Small, Hom-Set). A category \mathcal{C} is said to be **locally small** if for all $X, Y \in \mathcal{C}$, $\mathcal{C}(X, Y)$ is a set. If \mathcal{C} is locally small, $\mathcal{C}(X, Y)$ is called a **hom-set** for all $X, Y \in \mathcal{C}$.

Functors.

Definition 1.3 (Functor). Let \mathcal{C} and \mathcal{D} be categories. A functor $F: \mathcal{C} \to \mathcal{D}$ is a pair of functions (F_1, F_2) , $F_1: ob(\mathcal{C}) \to ob(\mathcal{D})$, called the **object function** and $F_2: mor(\mathcal{C}) \to mor(\mathcal{D})$, called the **morphism function**, such that for every morphism $f: X \to Y$ we have that $F_2(f): F_1(X) \to F_1(Y)$ and (F_1, F_2) is subject to the following **compatibility conditions**:

- For all $X \in ob(\mathcal{C})$, $F_2(id_X) = id_{F_1(X)}$.
- For all $f \in \mathcal{C}(X,Y)$ and $g \in \mathcal{C}(Y,Z)$ we have that $F_2(g \circ f) = F_2(g) \circ F_2(f)$.

Remark 1.2. Let $F: \mathcal{C} \to \mathcal{D}$ be a functor. It is convenient to denote the components F_1 and F_2 also with F.

Subcategories.

Definition 1.4 (Subcategory). Let \mathcal{C} be a category. A subcategory S of \mathcal{C} consists of

- A subclass $ob(S) \subseteq ob(C)$.
- A subclass $mor(S) \subseteq mor(C)$.

Subject to the following conditions:

• For all $X \in \mathcal{S}$, $id_{\mathcal{S}} \in mor(\mathcal{S})$.

Example 1.2 (Top*). Define the objects of Top* to be the class of all tuple (X, p), where X is a topological space and $p \in X$. Moreover, given objects (X, p) and (Y, q) in Top*, define Top* $((X, p), (Y, q)) := \{ f \in \text{Top}(X, Y) : f(p) = q \}$. It is easy to check that Top* is a category, called the *category of pointed topological spaces*.

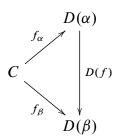

Limits.

Definition 1.5 (Diagram). Let \mathcal{C} be a category and A a small category. A functor $A \to \mathcal{C}$ is called a **diagram in \mathcal{C} of shape A**.

Definition 1.6 (Cone and Limit). Let \mathcal{C} be a category and $D: A \to \mathcal{C}$ a diagram in \mathcal{C} of shape A. A **cone on D** is a tuple $(C, (f_{\alpha})_{\alpha \in A})$, where $C \in \mathcal{C}$ is an object, called the **vertex** of the cone, and a family of arrows in \mathcal{C}

$$\left(C \xrightarrow{f_{\alpha}} D(\alpha)\right)_{\alpha \in A}. \tag{5}$$

such that for all morphisms $f \in A$, $f : \alpha \to \beta$, the triangle

commutes. A (small) limit of D is a cone $(L, (\pi_{\alpha})_{\alpha \in A})$ with the property that for any other cone $(C, (f_{\alpha})_{\alpha \in A})$ there exists a unique morphism $\overline{f}: C \to L$ such that $\pi_{\alpha} \circ \overline{f} = f_{\alpha}$ holds for every $\alpha \in A$.

Remark 1.3. In the setting of definition 1.6, if $(L, (\pi_{\alpha})_{\alpha \in A})$ is a limit of D, we sometimes reffering to L only as the limit of D and we write

$$L = \lim_{\leftarrow A} D. \tag{6}$$

Basic Algebra

The Isomorphism Theorems.

CHAPTER 2

The Fundamental Group

The Fundamental Grupoid

Construction of the fundamental Grupoid.

Lemma 2.1 (Gluing Lemma). Let $X, Y \in \text{ob}(\mathsf{Top})$, $(X_{\alpha})_{\alpha \in A}$ a finite closed cover of X and $(f_{\alpha})_{\alpha \in A}$ a finite family of maps $f_{\alpha} \in \mathsf{Top}(X_{\alpha}, Y)$ such that $f_{\alpha}|_{X_{\alpha} \cap X_{\beta}} = f_{\beta}|_{X_{\alpha} \cap X_{\beta}}$ for all $\alpha, \beta \in A$. Then there exists a unique $f \in \mathsf{Top}(X, Y)$ such that $f|_{X_{\alpha}} = f_{\alpha}$ for all $\alpha \in A$.

Proof. Let $x \in X$. Since $(X_{\alpha})_{\alpha \in A}$ is a cover of X, we find $\alpha \in A$ such that $x \in X_{\alpha}$. Define $f(x) := f_{\alpha}(x)$. This is well defined, since if $x \in X_{\alpha} \cap X_{\beta}$ for some $\beta \in A$, we have that $f(x) = f_{\beta}(x) = f_{\alpha}(x)$. Clearly $f|_{X_{\alpha}} = f_{\alpha}$ for all $\alpha \in A$ and β is unique. Let us show continuity. To this end, let $K \subseteq Y$ be closed. Then

$$f^{-1}(K) = X \cap f^{-1}(K)$$

$$= \bigcup_{\alpha \in A} X_{\alpha} \cap f^{-1}(K)$$

$$= \bigcup_{\alpha \in A} (X_{\alpha} \cap f^{-1}(K))$$

$$= \bigcup_{\alpha \in A} (X_{\alpha} \cap f_{\alpha}^{-1}(K)).$$

Since each f_{α} is continuous, $f_{\alpha}^{-1}(K)$ is closed in X_{α} for each $\alpha \in A$ and thus since X_{α} is closed, $f^{-1}(K)$ is closed as a finite union of closed sets.

Theorem 2.1. There is a functor Top \rightarrow Grpd.

Proof. The proof is divided into several steps. Let us denote Π : Top \rightarrow Grpd for the claimed functor.

Step 1: Definition of Π on objects. Let $X, Y \in \text{ob}(\mathsf{Top}), f, g \in \mathsf{Top}(X, Y)$ and $A \subseteq X$. A map $F \in \mathsf{Top}(X \times I, Y)$ is called a **homotopy from X to Y relative to A**, if

- F(x,0) = f(x), for all $x \in X$.
- F(x, 1) = g(x), for all $x \in X$.
- F(x,t) = f(x) = g(x), for all $x \in A$ and for all $t \in I$.

If there exists a homotopy between f and g relative to A we say that f and g are **homotopic** relative to A and write $f \simeq_A g$. If we want to emphasize the homotopy relative to A, we write $F : f \simeq_A g$.

Lemma 2.2. Let $X, Y \in \text{ob}(\mathsf{Top})$ and $A \subseteq X$. Then being homotopic relative to A is an equivalence relation on $\mathsf{Top}(X,Y)$.

Proof. Define a binary relation $R_A \subseteq \mathsf{Top}(X,Y) \times \mathsf{Top}(X,Y)$ by

$$fR_Ag$$
 : \Leftrightarrow $f \simeq_A g$.

Let $f \in \text{Top}(X, Y)$. Define $F \in \text{Top}(X \times I, Y)$ by

$$F(x,t) := f(x)$$
.

Then clearly $F: f \simeq_A f$. Hence R_A is reflexive.

Let $g \in \text{Top}(X, Y)$ and assume that fR_Ag . Thus $G : f \simeq_A g$. Define $F \in \text{Top}(X \times I, Y)$ by

$$F(x,t) := G(x, 1-t).$$

Then it is easy to check that $F: g \simeq_A f$ and so R_A is symmetric.

Finally, let $h \in \text{Top}(X, Y)$ and suppose that fR_Ag and gR_Ah . Hence $F_1: f \simeq_A g$ and $F_2: g \simeq_A h$. Define $F \in \text{Top}(X \times I, Y)$ by

$$F(x,t) := \begin{cases} F_1(x,2t) & 0 \le t \le \frac{1}{2}, \\ F_2(x,2t-1) & \frac{1}{2} \le t \le 1. \end{cases}$$

Continuity of F follows by an application of the gluing lemma 2.1. Then it is easy to check that $F: f \simeq_A h$ and hence R_A is transitive.

Let $X \in \text{ob}(\mathsf{Top})$ and u a path in X from p to q. Define the **path class [u] of u** by $[u] := [u]_{R_{\mathcal{U}}}$. Define now

- ob $(\Pi(X)) := X$.
- $\Pi(X)(p,q) := \{[u] : u \text{ is a path from } p \text{ to } q\} \text{ for all } p,q \in X.$
- Let $p \in X$. Then define $\mathrm{id}_p \in \Pi(X)(p,p)$ by $\mathrm{id}_p := [c_p]$, where c_p is the constant path defined by $c_p(s) := p$ for all $s \in I$.
- And $\Pi(X)(q,r) \times \Pi(X)(p,q) \to \Pi(X)(p,r)$ by

$$([v],[u]) \mapsto [u * v]$$

Where $u * v \in \text{Top}(p, r)$ is the *concatenated path of u and v*, defined by

$$(u * v)(s) := \begin{cases} u(2s) & 0 \le t \le \frac{1}{2}, \\ v(2s-1) & \frac{1}{2} \le t \le 1 \end{cases}.$$

Continuity follows again from the gluing lemma 2.1 whereas well definedness follows from the next lemma.

Lemma 2.3. Suppose that $[u_1]$, $[u_2] \in \Pi(X)(p,q)$ and $[v_1]$, $[v_2] \in \Pi(X)(q,r)$ such that $[u_1] = [u_2]$ and $[v_1] = [v_2]$. Then $[u_1 * v_1] = [u_2 * v_2]$.

Proof. By assumption we have $G: u_1 \simeq_{\partial I} u_2$ and $H: v_1 \simeq_{\partial I} v_2$. Define $F \in \text{Top}(I \times I, X)$ by

$$F(s,t) := \begin{cases} G(2s,t) & 0 \le s \le \frac{1}{2}, \\ H(2s-1,t) & \frac{1}{2} \le s \le 1. \end{cases}$$

Again, continuity follows from the gluing lemma 2.1 and it is easy to check that $F: u_1 * v_1 \simeq_{\partial I} u_2 * v_2$.

Let us now check that $\Pi(X)$ is indeed a category. Let $[u] \in \Pi(X)(p,q)$. We want to show that $u \simeq_{\partial I} c_p * u$. To this end, we consider figure 1a and conclude that a suitable homotopy is given by $F \in \text{Top}(I \times I, X)$ defined by

$$F(s,t) := \begin{cases} p & 0 \le 2s \le t, \\ u\left(\frac{2s-t}{2-t}\right) & t \le 2s \le 2. \end{cases}$$

Similarly, considering figure 1b leads to $F \in \text{Top}(I \times I, X)$ defined by

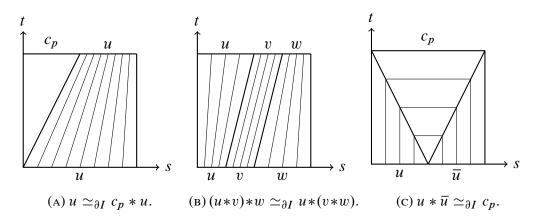

FIGURE 1. Visualization of the proof that $\Pi(X)$ is a grupoid object.

$$F(s,t) := \begin{cases} u\left(\frac{4s}{t+1}\right) & -1 \le 4s - 1 \le t, \\ v(4s - t - 1) & t \le 4s - 1 \le t + 1, \\ w\left(\frac{4s - t - 2}{4 - t - 2}\right) & t + 1 \le 4s - 1 \le 3. \end{cases}$$

Lastly, we check that $\Pi(X)$ is a grupoid. To this end, for a path u from p to q, define its **reverse path** \overline{u} by

$$\overline{u}(s) := u(1-s).$$

We claim that $u * \overline{u} \simeq_{\partial I} c_p$. From figure 1c we deduce that $F \in \text{Top}(I \times I, X)$ is given by

$$F(s,t) := \begin{cases} u(2s) & 0 \le 2s \le 1 - t, \\ u(1-t) & 1 - t \le 2s \le t + 1, \\ \overline{u}(2s-1) & t + 1 \le 2s \le 2. \end{cases}$$

Step 2: Definition of Π on morphisms. Let $f \in \text{Top}(X, Y)$. Then $\Pi(f)$ is a functor from $\Pi(X)$ to $\Pi(Y)$. Define $\Pi(f)$ as follows:

- Let $p \in \text{ob}(\Pi(X))$. Then define $\Pi(f)(p) := f(p) \in \text{ob}(\Pi(Y))$.
- Let $[u] \in \Pi(X)(p,q)$. Then define $\Pi(f)[u] := [f \circ u] \in$. We have to check that this definition is independent of the choice of the representative.

Lemma 2.4. Let u and v be paths from p to q in X and suppose that [u] = [v]. Then for any $f \in \text{Top}(X, Y)$ we also have that $[f \circ u] = [f \circ v]$.

Proof. Suppose that $H: u \simeq_{\partial I} v$. Define $F \in \text{Top}(I \times I, Y)$ by

$$F(s,t) := (f \circ F)(s,t).$$

Then $F: f \circ u \simeq_{\partial I} f \circ v$.

Checking that Π satisfies the functorial properties is left as an exercise.

Exercise 2.1. Check that $\Pi : \mathsf{Top} \to \mathsf{Grpd}$ is indeed a functor.

The Fundamental Group.

Lemma 2.5. Let \mathcal{G} be a locally small grupoid. Then for every $X \in \text{ob}(\mathcal{G})$, $\mathcal{G}(X, X)$ can be equipped with a group structure.

Proof. Since \mathcal{G} is locally small, $\mathcal{G}(X,X)$ is a set for every $X \in \text{ob}(\mathcal{G})$. Define a multiplication $\mathcal{G}(X,X) \times \mathcal{G}(X,X) \to \mathcal{G}(X,X)$ by $gh := h \circ g$. Clearly, this multiplication is associative. Moreover, the identity element is given by $\text{id}_X \in \mathcal{G}(X,X)$ and since every $g \in \mathcal{G}(X,X)$ is an isomorphism, the multiplicative inverse is given by the inverse in $\mathcal{G}(X,X)$.

Proposition 2.1. There is a functor $Top_* \to Grp$.

Proof. Define $\pi_1 : \mathsf{Top}_* \to \mathsf{Grp}$ on objects $(X, p) \in \mathsf{Top}_*$ by

$$\pi_1(X, p) := \Pi(X)(p, p).$$

By theorem 2.1 together with lemma 2.5, $\pi_1(X, p)$ is actually a group, called the **fundamental group of X with basepoint p**. On morphisms $f \in \text{Top}_*((X, p), (Y, q))$, define

$$\pi_1(f) := \Pi(f) : \Pi(X)(p, p) \to \Pi(Y)(q, q).$$

Let $[u], [v] \in \pi_1(X, p)$. Then

$$\pi_{1}([u][v]) = \Pi(f)([u][v])$$

$$= \Pi(f)[u * v]$$

$$= [f \circ (u * v)]$$

$$= [(f \circ u) * (f \circ v)]$$

$$= \Pi(f)[u]\Pi(f)[v]$$

$$= \pi_{1}(f)[u]\pi_{1}(f)[v].$$

Thus $\pi_1(f)$ is a morphism in Grp. Functoriality of π_1 immediately follows from the functoriality of Π .

Lemma 2.6. Let $X \in \text{ob}(\mathsf{Top})$, $p \in X$ and A be the path component of X containing p. Then $\pi_1(\iota)$, where $\iota : A \hookrightarrow X$ denotes the inclusion, is an isomorphism.

Proof. Suppose $[u] \in \ker \pi_1(\iota)$. Then $[\iota \circ u] = [c_p]$ and Hence $F : \iota \circ u \simeq_{\partial I} c_p$. Since $I \times I$ is path connected and $p \in F(I \times I)$, it follows that $F(I \times I) \subseteq A$ and thus $F : u \simeq_{\partial I} c_p$ in A and hence $[u] = [c_p]$. To see that $\pi_1(\iota)$ is surjective, just observe that $u(I) \subseteq A$ for $[u] \in \pi_1(X, p)$ since u(I) is path connected and $p \in u(I)$.

Lemma 2.7. Let $X \in \text{ob}(\mathsf{Top})$ be path connected and $p, q \in X$. Then

$$\pi_1(X, p) \cong \pi_1(X, q).$$

Proof. Since X is path connected we find a path v from p to q in X. Define a mapping $\Phi_v: \pi_1(X,p) \to \pi_1(X,q)$

$$\Phi_v[u] := [\overline{v} * u * v].$$

Clearly, Φ_v is invertible with inverse $\Phi_{\overline{v}}$. Moreover, for [u], $[w] \in \pi_1(X, p)$ we have that

$$\Phi_{v}([u][w]) = \Phi_{v}[u * w]
= [\overline{v} * u * w * v]
= [\overline{v} * u * v * \overline{v} * w * v]
= [\overline{v} * u * v] [\overline{v} * w * v]
= \Phi_{v}[u] \Phi_{v}[w].$$

 $\pi_1(\mathbb{S}^1)$.

Definition 2.1 (Exponential Quotient Map and Fundamental Loop). The mapping $\varepsilon : \mathbb{R} \to \mathbb{S}^1$ defined by

$$\varepsilon(x) := e^{2\pi i x} \tag{7}$$

is called the **exponential quotient map**. Moreover, the **fundamental loop** ω is defined to be the restriction $\omega := \varepsilon|_I$.

Proposition 2.2 (Lifting Property of the Circle). Let $n \in \mathbb{Z}$, $n \geq 0$, $X \subseteq \mathbb{R}^n$ compact and convex, $p \in X$, $f \in \mathsf{Top}_*((X, p), (\mathbb{S}^1, 1))$ and $m \in \mathbb{Z}$. Then there exists a unique map $\tilde{f} \in \mathsf{Top}_*((X, p), (\mathbb{R}, m))$, called the **lifting of** f, such that

$$(\mathbb{R}, m)$$

$$\downarrow \varepsilon$$

$$(X, p) \xrightarrow{f} (\mathbb{S}^1, 1)$$

commutes.

Proof. We show first existence and then uniqueness.

Step 1: Existence. Since X is compact and f is continuous, f is uniformly continuous on X. Thus we find $\delta > 0$ such that |f(x) - f(y)| < 2, whenever $|x - y| < \delta$, i.e. f(x) and f(y) are not antipodal points. Moreover, since X is compact, X is bounded and hence we find $N \in \mathbb{N}$, such that $|x - y| < N\delta$ holds for all $x, y \in X$. Let $x \in X$. For $0 \le k \le N$, define $L_k : X \to X$ by

$$L_k(x) := \left(1 - \frac{k}{N}\right)p + \frac{k}{N}x.$$

Those are well defined functions since X is convex. Moreover, each L_k is continuous. Indeed, it is easy to check that L_k is Lipschitz. Also, for each $0 \le k < N$, $f(L_k(x))$ and $f(L_{k+1}(x))$ are not antipodal for all $x \in X$. Indeed, it is easy to check that $|L_k(x) - L_{k+1}(x)| < \delta$ holds for all $x \in X$. For $0 \le k < N$ define $g_k : X \to \mathbb{S}^1 \setminus \{-1\}$ by

$$g_k(x) := \frac{f(L_{k+1}(x))}{f(L_k(x))}.$$

Clearly g_k is well defined and continuous as a composition of continuous functions. Let $\text{Log}: \mathbb{S}^1 \setminus \{-1\} \to \mathbb{C}$ denote the principal branch of the logarithm. Define $\tilde{f}: X \to \mathbb{R}$ by

$$\tilde{f}(x) := m + \frac{1}{2\pi i} \sum_{k=0}^{N-1} \text{Log}(g_k(x)).$$

Clearly, \tilde{f} is continuous and moreover we have that $\tilde{f} = m$ since $g_k(p) = 1$ for all $0 \le k < N$. Finally, for any $x \in X$ we have that

$$(\varepsilon \circ \widetilde{f})(x) = \varepsilon(m) \prod_{k=0}^{N-1} g_k(x) = \frac{f(L_N(x))}{f(L_0(x))} = \frac{f(x)}{f(p)} = f(x).$$

Step 2: Uniqueness. Suppose $\tilde{g} \in \text{Top}_*((X, p), (\mathbb{R}, m))$ is another such function. Define $\varphi \in \text{Top}_*((X, p), (\mathbb{R}, 0))$ by

$$\varphi(x) := \tilde{f}(x) - \tilde{g}(x).$$

Then clearly $\varepsilon \circ \varphi = 1$ and thus $\varphi(X) \subseteq \mathbb{Z}$. Since X is convex, X is connected and so $\varphi = 0$.

Corollary 2.1. Let $u, v \in \Omega(\mathbb{S}^1, 1)$ such that [u] = [v]. If $\widetilde{u}, \widetilde{v} : (I, 0) \to (\mathbb{R}, 0)$ are the liftings of u and v, respectively, then $[\widetilde{u}] = [\widetilde{v}]$.

Proof. Let $F: u \simeq_{\partial I} v$. By proposition 2.2, we find $\widetilde{F} \in \mathsf{Top}_* \big((I \times I, (0,0)), (\mathbb{R},0) \big)$, such that $\varepsilon \circ \widetilde{F} = F$. We claim that $\widetilde{F}: \widetilde{u} \simeq_{\partial I} \widetilde{v}$. For $s \in I$ define $\widetilde{u}_0(s) := \widetilde{F}(s,0)$. Then $\widetilde{u}_0(0) = \widetilde{F}(0,0) = 0$ and since \widetilde{u}_0 is continuous we have that $\widetilde{u}_0 \in \mathsf{Top}_* \big((I,0), (\mathbb{R},0) \big)$. Moreover

$$(\varepsilon \circ \widetilde{u}_0)(s) = \varepsilon (\widetilde{F}(s,0)) = F(s,0) = u(s)$$

for all $s \in I$ and thus \widetilde{u}_0 is a lifting of u. But by proposition 2.2, liftings are unique and thus $\widetilde{u}_0 = \widetilde{u}$. Next define $\widetilde{w}_0(t) := \widetilde{F}(0,t)$ for all $t \in I$. Then $\widetilde{w}_0(0) = \widetilde{F}(0,0) = 0$ and so $\widetilde{w}_0 \in \mathsf{Top}_* \big((I,0), (\mathbb{R},0) \big)$. Moreover

$$(\varepsilon \circ \widetilde{w}_0)(t) = \varepsilon \left(\widetilde{F}(0, t) \right) = F(0, t) = u(0) = v(0) = 1.$$

for all $t \in I$. Thus

$$(\mathbb{R},0)$$

$$\downarrow^{\varepsilon}$$

$$(I,0) \xrightarrow{c_1} (\mathbb{S}^1,1)$$

commutes. But also c_0 makes the above diagram commute. By uniqueness, $\widetilde{w}_0 = c_0$. Define $\widetilde{v}_0(s) := \widetilde{F}(s,1)$ for all $s \in I$. Then $\widetilde{v}_0(0) = \widetilde{F}(0,1) = \widetilde{w}_0(1) = 0$ and it is easy to check that \widetilde{v}_0 is a lift for v. Hence $\widetilde{v}_0 = \widetilde{v}$. Finally, define $\widetilde{w}_1(t) := \widetilde{F}(1,t)$ for all $t \in I$. Then $\widetilde{w}_1(0) = \widetilde{F}(1,0) = \widetilde{u}(1)$ and thus $\widetilde{w}_1 \in \operatorname{Top}_*(I,0), (\mathbb{R},\widetilde{u}(0))$. Moreover

$$(\varepsilon \circ \widetilde{w}_1)(t) = \varepsilon \left(\widetilde{F}(1,t) \right) = F(1,t) = v(1) = u(1) = 1$$

for all $t \in I$. By proposition 2.2, we have again that $\widetilde{w}_1 = c_{\widetilde{u}(1)}$. So $F : \widetilde{u} \simeq_{\partial I} \widetilde{v}$.

Definition 2.2 (Degree). Let $u \in \Omega(\mathbb{S}^1, 1)$. The **degree of u**, written $\deg u$, is defined by $\deg u := \widetilde{u}(1)$, where \widetilde{u} is the unique lift of u such that $\widetilde{u}(0) = 0$.

Theorem 2.2 (Fundamental Group of the Circle). $\pi_1(\mathbb{S}^1) \cong \mathbb{Z}$.

Proof. Define deg : $\pi_1(\mathbb{S}^1, 1) \to \mathbb{Z}$ by deg $[u] := \deg u$. This is well defined by corollary 2.1, since if [u] = [v], then $[\widetilde{u}] = [\widetilde{v}]$ and in particular $\widetilde{u}(1) = \widetilde{v}(1)$. Step 1: deg \in Grp $(\pi_1(\mathbb{S}^1, 1), (\mathbb{Z}, +))$. Let $[u], [v] \in \pi_1(\mathbb{S}^1, 1)$ and $m := \deg [u]$,

 $n := \deg[v]$. Moreover, let \widetilde{u} and \widetilde{v} denote the unique liftings of u and v, respectively, such that $\widetilde{u}(0) = 0$ and $\widetilde{v}(0) = 0$. Define

$$\widetilde{w}(s) := \begin{cases} \widetilde{u}(2s) & 0 \le s \le \frac{1}{2}, \\ m + \widetilde{v}(2s - 1) & \frac{1}{2} \le s \le 1. \end{cases}$$

Clearly \widetilde{w} is continuous and $\widetilde{w}(0) = 0$. Hence $\widetilde{w} \in \mathsf{Top}_*((I,0),(\mathbb{R},0))$. Also we have that $\varepsilon \circ \widetilde{w} = u * v$ and thus \widetilde{w} is the lift of u * v. But $\widetilde{w}(1) = m + n$ and so

$$\deg([u][v]) = \deg[u * v] = \deg(u * v) = \tilde{w}(1) = m + n = \deg[u] + \deg[v].$$

Step 2: deg is injective. Suppose deg [u] = 0. Then $\tilde{u}(1) = 0$ and thus $\tilde{u} \in \Omega(\mathbb{R}, 0)$. Since \mathbb{R} is contractible, we have that $[\tilde{u}] = [c_0]$ and thus

$$[u] = [\varepsilon \circ \widetilde{u}] = \pi_1(\varepsilon) [\widetilde{u}] = \pi_1(\varepsilon) [c_0] = [c_1].$$

Thus ker(deg) is trivial.

Step 3: deg is surjective. Let $m \in \mathbb{Z}$. Then

$$\deg\left[\varepsilon^{m}\right] = \deg \varepsilon^{m} = \widetilde{\varepsilon^{m}}(1) = m.$$

The Seifert-Van Kampen Theorem

Coproducts and Pushouts in Grp.

Proposition 2.3 (Coproducts in Grp). Grp has all small coproducts.

Proof. Let $A \in \text{ob}(\mathsf{Set})$ and A be the small category defined as the discrete category with $\text{ob}(\mathsf{A}) := A$, i.e.

• • • • • • •

Let $D: A \to Grp$ be a functor. Hence we get a family $(G_{\alpha})_{\alpha \in A}$ in Grp, where $G_{\alpha} := D(\alpha)$ for all $\alpha \in A$. A **word** in $(G_{\alpha})_{\alpha \in A}$ is a finite sequence in $\coprod_{\alpha \in A} G_{\alpha}$. A word in $(G_{\alpha})_{\alpha \in A}$ will simply be written as (g_1, \ldots, g_n) , where $g_k \in G_{\alpha}$ for some $\alpha \in A$. The **empty word** is denoted by (). Let W denote the set of all words in $(G_{\alpha})_{\alpha \in A}$. On W define a multiplication by **concatenation**

$$(g_1, \ldots, g_n)(h_1, \ldots, h_m) := (g_1, \ldots, g_n, h_1, \ldots, h_m).$$

An *elementary reduction* is an operation of one of the following forms:

- $(g_1, \ldots, g_k, g_{k+1}, \ldots, g_n) \mapsto (g_1, \ldots, g_k g_{k+1}, \ldots, g_n)$, where $g_k, g_{k+1} \in G_\alpha$ for some $\alpha \in A$.
- $(g_1, \ldots, g_{k-1}, 1_{\alpha}, g_{k+1}, \ldots, g_n) \mapsto (g_1, \ldots, g_{k-1}, g_{k+1}, \ldots, g_n).$

Let \sim denote the equivalence relation on W generated by elementary reductions.

Lemma 2.8. W/\sim together with concatenation of representatives is an element of Grp.

Proof. Define

$$[(g_1,\ldots,g_n)][(h_1,\ldots,h_m)] := [(g_1,\ldots,g_n,h_1,\ldots,h_m)].$$

It is left to the reader to show that this is well defined and that \mathcal{W}/\sim is indeed a group. \square The group defined in lemma 2.8 will be denoted by $\bigstar_{\alpha\in A}G_{\alpha}$ and called the *free product of* $(G_{\alpha})_{\alpha\in A}$. Let us define a cocone on D. For this consider the inclusions $\iota_{\alpha}: G_{\alpha} \to \bigstar_{\alpha\in A}G_{\alpha}$ defined by

$$\iota_{\alpha}(g) := [(g)]$$

for all $\alpha \in A$. It is immediate from

$$\iota_{\alpha}(gh) = [(gh)] = [(g,h)] = [(g)][(h)] = \iota_{\alpha}(g)\iota_{\alpha}(h)$$

for $g, h \in G_{\alpha}$, that ι_{α} is a morphism of groups. Since there are only the identity morphisms in A, $(\bigstar_{\alpha \in A} G_{\alpha}, (\iota_{\alpha})_{\alpha \in A})$ is a cocone on D. Let us show that this is in fact a universal cocone. To this end, suppose that $(C, (\varphi_{\alpha})_{\alpha \in A})$ is another cocone on D. Define a mapping $\overline{f}: \bigstar_{\alpha \in A} G_{\alpha} \to C$ by

$$\overline{f}[(g_1,\ldots,g_n)] := \varphi_{\alpha_1}(g_1)\cdots\varphi_{\alpha_n}(g_n)$$

where $g_k \in G_{\alpha_k}$. Then \overline{f} is easily seen to be well defined since each φ_{α} is a morphism of groups. Moreover, if $g \in G_{\alpha}$, then

$$(\bar{f} \circ \iota_{\alpha})(g) = \bar{f}[(g)] = \varphi_{\alpha}(g)$$

for all $\alpha \in A$. Suppose that $f: \bigstar_{\alpha \in A} G_{\alpha} \to C$ is another homomorphism of groups such that $f \circ \iota_{\alpha} = \varphi_{\alpha}$ for all $\alpha \in A$. Then for $[(g_1, \ldots, g_n)] \in \bigstar_{\alpha \in A} G_{\alpha}$ we have

$$f [(g_1, \dots, g_n)] = f([(g_1)] \cdots [(g_n)])$$

$$= f [(g_1)] \cdots f [(g_n)]$$

$$= f (\iota_{\alpha_1}(g_1)) \cdots f (\iota_{\alpha_n}(g_n))$$

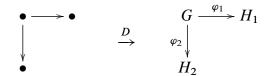

$$= \varphi_{\alpha_1}(g_1) \cdots \varphi_{\alpha_n}(g_n)$$

$$= \overline{f} [(g_1, \dots, g_n)].$$

Exercise 2.2. Check that W/\sim is indeed a group with the declared group structure and that \overline{f} is indeed well defined.

Proposition 2.4 (Pushouts in Grp). Grp has all pushouts.

Proof. Consider the diagram $D: A \rightarrow Grp$

and define N to be the normal subgroup of $H_1 * H_2$ generated by elements of the form $[(\varphi_1(g^{-1}), \varphi_2(g))]$ for $g \in G$. Let $K := (H_1 * H_2)/N$. Then

$$G \xrightarrow{\varphi_1} H_1$$

$$\varphi_2 \downarrow \qquad \qquad \downarrow \pi \circ \iota_1$$

$$H_2 \xrightarrow{\pi \circ \iota_2} K$$

commutes. Indeed, if $g \in G$, we have that $(\pi \circ \iota_1 \circ \varphi_1)(g) = [(\varphi_1(g))] N$ and similarly $(\pi \circ \iota_2 \circ \varphi_2)(g) = [(\varphi_2(g))] N$. Then

$$[(\varphi_1(g))]^{-1}[(\varphi_2(g))] = [(\varphi_1(g)^{-1})][(\varphi_2(g))] = [(\varphi_1(g^{-1}))][(\varphi_2(g))] \in N.$$

Suppose that we have another cocone on D:

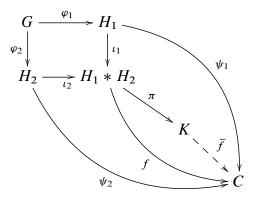

$$G \xrightarrow{\varphi_1} H_1$$

$$\downarrow \psi_1$$

$$\downarrow \psi_1$$

$$H_2 \xrightarrow{\psi_2} C$$

By proposition 2.3, there exists a unique morphism of groups $f: H_1 * H_2 \to C$ and we thus get the following diagram:

To show that $N \subseteq \ker f$ is left as an exercise. Hence by the factorization theorem (see [Gri07, p. 23]), f factors uniquely through π , i.e. there exists a unique morphism of groups $\overline{f}: K \to C$ such that $\overline{f} \circ \pi = f$.

Exercise 2.3. In the previous proposition, verify that $N \subseteq \ker f$.

Definition 2.3 (Amalgamated Free Product). The pushout of a diagram

$$G \xrightarrow{\varphi_1} H_1$$

$$\downarrow^{\varphi_2} \qquad \qquad H_2$$

in Grp is called the amalgamated free product of H_1 and H_2 along $(G, \varphi_1, \varphi_2)$, written $H_1 *_{(G, \varphi_1, \varphi_2)} H_2$.

The Seifert-Van Kampen Theorem and its Consequences.

Theorem 2.3 (Seifert-Van Kampen). Let $X \in \text{ob}(\mathsf{Top})$, (U, V) an open cover for X, such that U, V and $U \cap V$ are path connected. Moreover, let $p \in U \cap V$. Then

$$\pi_1(X, p) \cong \pi_1(U, p) *_{(\pi_1(U \cap V, p), \pi_1(\iota_U), \pi_1(\iota_V))} \pi_1(V, p), \tag{8}$$

where $\iota_U: U \cap V \hookrightarrow U$ and $\iota_V: U \cap V \hookrightarrow V$ denote inclusion.

CHAPTER 3

Singular Homology

Construction of the Singular Homology Functor

Aim of this section is to construct for each $n \in \omega$ a functor H_n : Top \to AbGrp, called the *n-th singular homology functor*.

Free Abelian Groups.

Proposition 3.1. *The forgetful functor* U : AbGrp \rightarrow Set *admits a left adjoint.*

Proof. We have to construct a functor $F: \mathsf{Set} \to \mathsf{AbGrp}$. Let S be a set. Define

$$F(S) := \{ f \in \mathbb{Z}^S : \text{supp } f \text{ is finite} \}.$$

Equipped with pointwise addition, F(S) is an abelian group. There is a natural inclusion $\iota: S \hookrightarrow U\left(F(S)\right)$ sending $x \in S$ to the function taking the value one at x and zero else. Hence we may regard elements of F(S) as formal linear combinations $\sum_{x \in S} m_x x$, where $m_x \in \mathbb{Z}$ for all $x \in S$. On morphisms $f: S \to T$ in Set, define $F(f): F(S) \to F(T)$ simply by setting $F(f)\left(\sum_{x \in S} m_x x\right) := \sum_{x \in S} m_x f(x)$.

Let $G \in \text{ob}(\mathsf{AbGrp})$ be an abelian group and $\varphi \in \mathsf{AbGrp}(F(S), G)$ a morphism of groups. Define $\overline{\varphi} \in \mathsf{Set}(S, U(G))$ by $\overline{\varphi} := U(\varphi)$. Conversly, if we have $f \in \mathsf{Set}(S, U(G))$, define $\overline{f} \in \mathsf{AbGrp}(F(S), G)$ by $\overline{f}(\sum_{x \in S} m_x x) := \sum_{x \in S} m_x f(x)$. This is well defined since all but finitely many m_x are zero and G is abelian. It is easy to check that \overline{f} is indeed a morphism of groups. Let $\varphi \in \mathsf{AbGrp}(F(S), G)$. Then

$$\overline{\overline{\varphi}}\left(\sum_{x\in S} m_x x\right) = \sum_{x\in S} m_x \overline{\varphi}(x)$$

$$= \sum_{x\in S} m_x U(\varphi)(x)$$

$$= \sum_{x\in S} m_x \varphi(x)$$

$$= \varphi\left(\sum_{x\in S} m_x x\right).$$

And for $f \in Set(S, U(G))$ we have that

$$\overline{\overline{f}}(x) = U(\overline{f})(x) = \overline{f}(x) = f(x).$$

Hence $\overline{\overline{\varphi}} = \varphi$ and $\overline{\overline{f}} = f$ and so we have a bijection

$$\mathsf{AbGrp}\left(F(S),G\right)\cong\mathsf{Set}\left(S,U(G)\right).$$

The mapping $f \mapsto \overline{f}$ will be referred to as *extending by linearity*. To check naturality in S and G is left as an exercise.

Exercise 3.1. In proposition 3.1, check that $F : Set \to AbGrp$ is indeed a functor, called the *free functor from* Set *to* AbGrp, and the naturality of the bijection in both arguments.

Definition 3.1 (Free Abelian Group). Let $F : Set \to AbGrp$ be the free functor. For any set S, we call F(S) the free group generated by S.

Chain Complexes.

Definition 3.2 (Chain Complex). A chain complex is a tuple $(C_{\bullet}, \partial_{\bullet})$ consisting of a sequence $(C_n)_{n \in \mathbb{Z}}$ in ob(AbGrp) and a sequence $(\partial_n)_{n \in \mathbb{Z}}$ in mor(AbGrp), called **boundary operators**, such that we have $\partial_n \in \mathsf{AbGrp}(C_n, C_{n-1})$ and $\partial_n \circ \partial_{n+1} = 0$ for all $n \in \mathbb{Z}$.

Definition 3.3 (Chain Maps). Let $(C_{\bullet}, \partial_{\bullet})$ and $(C'_{\bullet}, \partial'_{\bullet})$ be two chain complexes. A **chain map** $f_{\bullet}: C_{\bullet} \to C'_{\bullet}$ is a sequence $(f_n)_{n \in \mathbb{Z}}$ in mor(AbGrp) such that $f_n \in \mathsf{AbGrp}(C_n, C'_n)$ and the diagram

$$C_{n} \xrightarrow{\partial_{n}} C_{n-1}$$

$$f_{n} \downarrow \qquad \qquad \downarrow f_{n-1}$$

$$C'_{n} \xrightarrow{\partial'_{n}} C'_{n-1}$$

commutes for all $n \in \mathbb{Z}$.

Proposition 3.2. There is a category with objects chain complexes and morphisms chain maps.

Proof. Let $f_{\bullet}: C_{\bullet} \to C'_{\bullet}$ and $g_{\bullet}: C'_{\bullet} \to C''_{\bullet}$ be chain maps. Define a map $g_{\bullet} \circ f_{\bullet}$ by $g_n \circ f_n$ for each $n \in \mathbb{Z}$. This defines a chain map. Moreover, for each chain complex C_{\bullet} define $\mathrm{id}_{C_{\bullet}}$ by id_{C_n} for all $n \in \mathbb{Z}$. It is easy to check, that then \circ is associative and the identity laws hold.

Definition 3.4 (Comp). The category in 3.2 is called the **category of chain complexes** and we refer to it as Comp.

Theorem 3.1. There is a functor Top \rightarrow Comp.

Proof. The proof is divided into several steps. Let us denote C_{\bullet} : Top \rightarrow Comp for the claimed functor.

Step 1: Construction of a sequence of abelian groups. Let $v_0, \ldots, v_k \in \mathbb{R}^n$ for some $n, k \in \omega$. We say that (v_0, \ldots, v_k) is **affinely independent** if $(v_1 - v_0, \ldots, v_k - v_0)$ is linearly independent. We define the **k-simplex spanned by** (v_0, \ldots, v_k) , written $[v_0, \ldots, v_k]$, to be

$$[v_0, \dots, v_k] := \{ \sum_{i=0}^k s_i v_i : s_i \ge 0 \text{ for all } i = 0, \dots, k \text{ and } \sum_{i=0}^k s_i = 1 \}.$$
 (9)

equipped with the subspace topology. Moreover, we define the *standard n-simplex* Δ^n to be the *n*-simplex spanned by (e_0, \ldots, e_n) where $e_0 := 0 \in \mathbb{R}^n$ and (e_1, \ldots, e_n) is the standard ordered basis of \mathbb{R}^n . Let $X \in \text{ob}(\mathsf{Top})$. Define a *singular n-simplex in* X to be a morphism $\sigma \in \mathsf{Top}(\Delta^n, X)$. Let $n \in \mathbb{Z}$. Define

$$C_n(X) := \begin{cases} F\left(\mathsf{Top}(\Delta^n, X)\right) & n \ge 0, \\ 0 & n < 0. \end{cases}$$
 (10)

We will call elements of $C_n(X)$ singular n-chains.

Step 2: Construction of boundary operators. Let $X \in \text{ob}(\mathsf{Top})$ and σ a singular n-simplex in X for $n \geq 1$. We define $\varphi_k^n : \Delta^{n-1} \to \Delta^n$, called the k-th face map, to be the unique affine map determined by the vertex map

$$\begin{array}{cccc} & \varphi_k^n \\ e_0 & \mapsto & e_0 \\ \vdots & & \vdots \\ e_{k-1} & \mapsto & e_{k-1} \\ e_k & \mapsto & e_{k+1} \\ \vdots & & \vdots \\ e_{n-1} & \mapsto & e_n. \end{array}$$

Explicitely, given $\sum_{i=0}^{n-1} s_i e_i \in \Delta^{n-1}$, we have that (see [Lee11, p. 152])

$$\varphi_k^n\left(\sum_{i=0}^{n-1} s_i e_i\right) = \sum_{i=0}^{n-1} s_i \varphi_k^n(e_i).$$

Define now

$$\partial \sigma := \sum_{k=0}^{n} (-1)^k \sigma \circ \varphi_k^n \in U\left(C_{n-1}(X)\right)$$
(11)

to be the **boundary of** σ . Moreover, the **singular boundary operator** is defined to be $\overline{\partial_n}$ and $\partial_n := 0$ for $n \le 0$.

Step 3: $\partial_n \circ \partial_{n+1} = 0$ for all $n \in \mathbb{Z}$. It is enough to consider $n \ge 1$, since $\partial_n \circ \partial_{n+1} = 0$ holds trivially in the other cases. Let $X \in \text{ob}(\mathsf{Top})$ and $\sigma \in \mathsf{Top}(\Delta^{n+1}, X)$. Then we have

$$(\partial_{n} \circ \partial_{n+1})(\sigma) = \partial_{n} \left(\sum_{k=0}^{n+1} (-1)^{k} \sigma \circ \varphi_{k}^{n+1} \right)$$

$$= \sum_{k=0}^{n+1} (-1)^{k} \partial_{n} \left(\sigma \circ \varphi_{k}^{n+1} \right)$$

$$= \sum_{k=0}^{n+1} \sum_{j=0}^{n} (-1)^{k+j} \sigma \circ \varphi_{k}^{n+1} \circ \varphi_{j}^{n}$$

$$= \sum_{0 \le k \le j \le n} (-1)^{k+j} \sigma \circ \varphi_{k}^{n+1} \circ \varphi_{j}^{n} + \sum_{0 \le j < k \le n+1} (-1)^{k+j} \sigma \circ \varphi_{k}^{n+1} \circ \varphi_{j}^{n}$$

$$= \sum_{0 \le j \le k \le n} (-1)^{k+j} \sigma \circ \varphi_{j}^{n+1} \circ \varphi_{k}^{n} + \sum_{0 \le j < k \le n+1} (-1)^{k+j} \sigma \circ \varphi_{k}^{n+1} \circ \varphi_{j}^{n}$$

$$= \sum_{0 \le j < k \le n+1} \left((-1)^{k+j-1} \sigma \circ \varphi_{j}^{n+1} \circ \varphi_{k-1}^{n} + (-1)^{k+j} \sigma \circ \varphi_{k}^{n+1} \circ \varphi_{j}^{n} \right)$$

Since $\varphi_j^{n+1} \circ \varphi_{k-1}^n = \varphi_k^{n+1} \circ \varphi_j^n$, it follows that

$$\partial_n \circ \partial_{n+1} = 0.$$

Indeed, consider the following chart of vertex maps:

Step 4: Construction of chain maps. Let $X, Y \in \text{ob}(\mathsf{Top})$ and $f \in \mathsf{Top}(X, Y)$. For $n \geq 0$, define $f_n^\# : \mathsf{Top}(\Delta^n, X) \to U\left(C_n(Y)\right)$ by $f^\# := f \circ \sigma$. Extending this map by linearity yields a homomorphism $f_n^\# : C_n(X) \to C_n(Y)$. Moreover, set $f_n^\# := 0$ for n < 0. Let

 $n \ge 1$ and $\sigma \in \text{Top}(\Delta^n, X)$. Then on one hand we have

$$(f_{n-1}^{\#} \circ \partial_n)(\sigma) = f_{n-1}^{\#} \left(\sum_{k=0}^n (-1)^k \sigma \circ \varphi_k^n \right) = \sum_{k=0}^n (-1)^k f \circ \sigma \circ \varphi_k^n$$

and on the other

$$(\partial_n \circ f_n^{\#})(\sigma) = \partial_n (f \circ \sigma) = \sum_{k=0}^n (-1)^k f \circ \sigma \circ \varphi_k^n.$$

Checking, that C_{\bullet} is indeed a functor is left as an exercise.

Exercise 3.2. Show that C_{\bullet} : Top \rightarrow Comp is a functor.

The Homology Functor.

Proposition 3.3. For each $n \in \mathbb{Z}$ there exists a functor Comp \rightarrow AbGrp.

Proof. Let $(C_{\bullet}, \partial_{\bullet})$ be a chain complex. Let $x \in \text{im } \partial_{n+1}$. Hence there exists $y \in C_{n+1}$ such that $x = \partial_{n+1}y$. But then $\partial_n x = (\partial_n \circ \partial_{n+1})(y) = 0$ and thus im $\partial_{n+1} \subseteq \ker \partial_n$. Define

$$H_n(C_{\bullet}, \partial_{\bullet}) := \frac{\ker \partial_n}{\operatorname{im} \partial_{n+1}} \in \operatorname{ob}(\mathsf{AbGrp}).$$

Let $(C'_{\bullet}, \partial'_{\bullet})$ be a chain complex and $f_{\bullet}: C_{\bullet} \to C'_{\bullet}$ a chain map. Then $f_n(\ker \partial_n) \subseteq \ker \partial'_n$. Indeed, if $y \in f_n(\ker \partial_n)$, there exists $x \in \ker \partial_n$, such that $y = f_n(x)$. Since f_{\bullet} is a chain map, we thus have $\partial'_n y = (\partial'_n \circ f_n)(x) = (f_{n-1} \circ \partial_n)(x) = 0$. Moreover, we have that im $\partial_{n+1} \subseteq \ker \pi'_n \circ f_n$, where $\pi'_n : \ker \partial'_n \to H_n(C'_{\bullet}, \partial'_{\bullet})$ is the usual projection. Indeed, if $y \in \operatorname{im} \partial_{n+1}$, we find $x \in C_{n+1}$, such that $y = \partial_{n+1} x$. Since again f_{\bullet} is a chain map, we have that $f_n y = (f_n \circ \partial_{n+1})(x) = (\partial'_{n+1} \circ f_{n+1})(x) \in \operatorname{im} \partial'_{n+1} = \ker \pi'_n$. Hence $\pi'_n \circ f_n$ factors uniquely through $\pi_n : \ker \partial_n \to H_n(C_{\bullet}, \partial_{\bullet})$. Define $H_n(f_{\bullet})$ to be this map. \square

Remark 3.1. Let $(C_{\bullet}, \partial_{\bullet})$ be a chain complex and $n \in \mathbb{Z}$. Then we will write $\langle x \rangle$ for an element in $H_n(C_{\bullet}, \partial_{\bullet})$, the so-called *homology class*. Hence if $(C'_{\bullet}, \partial'_{\bullet})$ is another chain complex and $f_{\bullet}: C_{\bullet} \to C'_{\bullet}$ a chain map, then $H_n(f)\langle c \rangle = \langle f_n c \rangle$.

Definition 3.5 (Cycles and Boundaries). Let $(C_{\bullet}, \partial_{\bullet})$ be a chain complex and $n \in \mathbb{Z}$. Then elements of ker ∂_n are called **n-cycles** and elements of im ∂_{n+1} are called **n-boundaries**.

Definition 3.6 (Homology Functor). Let $n \in \mathbb{Z}$ and H_n : Comp \to AbGrp be the functor defined in proposition 3.3. We call H_n the **n-th homology functor**.

Definition 3.7 (Singular Homology Functor). *Let* $n \in \mathbb{Z}$. *The composition*

$$H_n \circ C_{\bullet} : \mathsf{Top} \to \mathsf{AbGrp}$$
 (12)

of the singular chain complex functor C_{\bullet} in theorem 3.1 and the n-th homology functor of proposition 3.3 is called the **singular homology functor**, written H_n^{sing} .

Remark 3.2. For notational purposes we will often refer to the functor H_n^{sing} simply as H_n .

First Properties of Singular Homolgy.

Proposition 3.4 (Zeroth Singular Homology Group). Let $X \in \text{ob}(\mathsf{Top})$ be non empty and path connected. Then $H_0(X) \cong \mathbb{Z}$.

Proof. Since $\partial_0: C_0(X) \to 0$, $\ker \partial_0 = C_0(X)$. Moreover, a map in $\operatorname{Top}(\Delta^0, X)$ can be identified with a point in X and hence an element of $C_0(X)$ can be written as $\sum_{x \in X} m_x x$. Define a mapping $\Phi: C_0(X) \to \mathbb{Z}$ by $\Phi\left(\sum_{x \in X} m_x x\right) := \sum_{x \in X} m_x$. This mapping is well defined since all but finitely many m_x are zero. It is also easy to check, that Φ is a morphism of groups and that Φ is surjective. We claim that $\ker \Phi = \operatorname{im} \partial_1$. Indeed, if $\sum_{x \in X} m_x x \in \ker \Phi$, then $\sum_{x \in X} m_x = 0$. Let $p \in X$. Since X is path connected, we find for each $x \in X$ a path σ_x from p to x. Consider the singular 1-chain $\sum_{x \in X} m_x \sigma_x$. Then we have

$$\partial_1 \left(\sum_{x \in X} m_x \sigma_x \right) = \sum_{x \in X} m_x \left(\sigma_x(1) - \sigma_x(0) \right) = \sum_{x \in X} m_x (x - p) = \sum_{x \in X} m_x x.$$

Hence $\sum_{x \in X} m_x x \in \text{im } \partial_1$. Conversly, it is enough to show the claim on basis elements $\sigma \in \text{Top}(\Delta^1, X)$. We have

$$\Phi(\partial_1 \sigma) = \Phi\left(\sigma(1) - \sigma(0)\right) = 1 - 1 = 0.$$

Hence the first isomorphism theorem [Gri07, p. 23] implies that $H_0(X) \cong \mathbb{Z}$.

Proposition 3.5 (The Dimension Axiom). Let $* \in ob(\mathsf{Top})$ be a one point space. Then $H_n(*) = 0$ for all $n \in \mathbb{Z}$, n > 0.

The Homotopy Axiom

Theorem 3.2 (The Homotopy Axiom). Let $f, g \in \text{Top}(X, Y)$ be freely homotopic. Then $H_n(f) = H_n(g)$ for all $n \in \mathbb{Z}$.

The Hurewicz Theorem

Abelianizations.

Proposition 3.6. The forgetful functor $U : AbGrp \rightarrow Grp$ admits a left adjoint.

Proof. Let $G \in \text{ob}(\mathsf{Grp})$. For $g, h \in G$, define the **commutator of g and h**, written [g, h], by $[g, h] := ghg^{-1}h^{-1}$. Moreover, set

$$X_G := \{ [g, h] : g, h \in G \}$$

and define the *commutator subgroup of G*, written [G, G], by $[G, G] := \langle X_G \rangle$.

Lemma 3.1. For all $G \in \text{ob}(\mathsf{Grp})$, $[G, G] \leq G$.

Proof. We follow [Lee11, p. 265]. Clearly, $[G, G] \leq G$. By [KM13, p. 31] we have that

$$\langle X \rangle = \{x_1 \cdots x_n : n \in \omega \setminus \{0\}, x_1, \dots, x_n \in X_G \cup X_G^{-1}\}.$$

It is easy to check that $X_G = X_G^{-1}$ and thus

$$\langle X \rangle = \{x_1 \cdots x_n : n \in \omega \setminus \{0\}, x_1, \dots, x_n \in X_G\}.$$

Let $k \in G$ and $x_1 \cdots x_n \in [G, G]$. Since

$$kx_1 \cdots x_n k^{-1} = kx_1 k^{-1} k x_2 k^{-1} k \cdots k x_n k^{-1}$$

it is enough to show that $k[g,h]k^{-1} \in [G,G]$ for all $g,h \in G$. But this immediately follows from

$$k[g,h]k^{-1} = kghg^{-1}h^{-1}k^{-1} = [kgk^{-1}, khk^{-1}].$$

Thus $[G, G] \leq G$.

Lemma 3.2. $G \in \text{ob}(\mathsf{AbGrp})$ if and only if $[G, G] = \{1\}$.

Proof. Let $G \in \text{ob}(\mathsf{AbGrp})$. Then [g,h] = 1 for all $g,h \in G$, which implies $X_G = \{1\}$ and thus $\langle X_G \rangle = \{1\}$. Conversly, since $X_G \subseteq [G,G] = \{1\}$, we have that [g,h] = 1 for all $g,h \in G$ which is equivalent to gh = hg for all $g,h \in G$.

Corollary 3.1. The quotient group G/[G,G] is abelian.

Proof. By lemma 3.2 it is enough to show that [G/[G,G],G/[G,G]] is trivial. We actually show that $X_{G/[G,G]}=\{1\}$. This immediately follows from

$$[g[G,G], h[G,G]] = ghg^{-1}h^{-1}[G,G] = [G,G]$$

for $g[G, G], h[G, G] \in G/[G, G]$.

Hence define Ab : Grp → AbGrp on objects by

$$Ab(G) := G/[G, G].$$

The abelian group Ab(G) is called the *abelianization of* G. On morphisms $\varphi: G \to H$ in Grp define $Ab(\varphi): Ab(G) \to Ab(H)$ by setting $Ab(\varphi)(g[G,G]) := \varphi(g)[H,H]$. It is easy to check that this is a well defined morphism of abelian groups.

Let $H \in \text{ob}(\mathsf{AbGrp})$ and $\psi \in \mathsf{AbGrp}(\mathsf{Ab}(G), H)$. Define $\overline{\psi} \in \mathsf{Grp}(G, U(H))$ by setting $\overline{\psi}(g) := \psi(g[G,G])$. If $\varphi \in \mathsf{Grp}(G,U(H))$, define $\overline{\varphi} \in \mathsf{AbGrp}(\mathsf{Ab}(G), H)$ by $\overline{\varphi}(g[G,G]) := \varphi(g)$. It is easy to check that this mapping is actually well defined and that $\overline{\psi} = \psi$ and $\overline{\overline{\varphi}} = \varphi$ holds.

Exercise 3.3. In proposition 3.6, check that Ab : $Grp \rightarrow AbGrp$ is indeed a functor and the naturality of the bijection in both arguments.

The Hurewicz Morphism. Since elements of $H_1(X)$ are homology classes of loops, one might suspect that there is a connection between the fundamental group $\pi_1(X, p)$ of a path connected space X at p and the first singular homology group $H_1(X)$. However, since $H_1(X)$ is always abelian and $\pi_1(X, p)$ is not necessarily abelian, they cannot be equal. In this section we use a little trick which makes matters simpler: if c is any singular n-chain, not necessarily an n-cycle, we can also take its equivalence class modulo n-boundaries. We shall denote this class also with $\langle c \rangle$. Clearly, if c is an n-cycle, then $\langle c \rangle$ is the usual homology class.

Theorem 3.3 (Hurewicz Theorem). Let $X \in \text{ob}(\mathsf{Top})$ be path connected and $p \in X$. Then $\mathsf{Ab}(\pi_1(X,p)) \cong H_1(X)$.

Proof. We show the result in a sequence of lemmata.

Lemma 3.3. The mapping $h: \pi_1(X, p) \to H_1(X)$ defined by $h([u]) := \langle u \rangle$ is well defined.

Proof. First of all, since $u \in \Omega(X,p)$, we have that $u \in C_1(X)$. Moreover, $\partial u = u(1) - u(0) = p - p = 0$. Thus u has a homology class $\langle u \rangle$. Let us check that h is well defined. Suppose that [u] = [v]. Hence $F : u \simeq_{\partial I} v$. Consider the fundamental loop $\omega \in \Omega(\mathbb{S}^1,1)$. By [Lee11, p. 70], ω is a quotient map. Since $u,v \in \Omega(X,p)$, there exist $\widetilde{u},\widetilde{v} \in \operatorname{Top}(\mathbb{S}^1,X)$, such that $\widetilde{u} \circ \omega = u$ and $\widetilde{v} \circ \omega = v$ (see [Lee11, p. 72]). Since I is a locally compact Hausdorff space [Lee11, p. 107] implies that $\omega \times \operatorname{id}_I$ is a quotient map. Thus F passes to the quotient and yields a map $\widetilde{F} \in \operatorname{Top}(\mathbb{S}^1 \times I,X)$. Now it is easy to check that $\widetilde{F} : \widetilde{u} \simeq_{\{1\}} \widetilde{v}$. Thus an application of the homotopy axiom yields

$$\langle u \rangle = \langle \widetilde{u} \circ \omega \rangle = H_1(\widetilde{u}) \langle \omega \rangle = H_1(\widetilde{v}) \langle \omega \rangle = \langle \widetilde{v} \circ \omega \rangle = \langle v \rangle.$$

Lemma 3.4. Let u be a path in X from p to q. Then $\langle \overline{u} \rangle = -\langle u \rangle$.

Proof. From figure 2a, we deduce that an appropriate definition of a singular 2-simplex σ would be

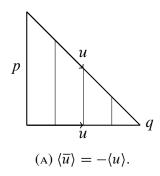

$$\sigma(x, y) := u(x)$$
.

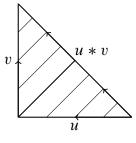

Indeed

$$\partial \sigma = \overline{u} - c_p + u$$

and since c_p is the boundary of $\sigma_p \in \mathsf{Top}(\Delta^2, X)$ defined by $\sigma_p(x, y) := p$, we have that $\overline{u} + u$ is a boundary.

Lemma 3.5. Let u and v be paths in X from p to q and from q to r, respectively. Then $\langle u * v \rangle = \langle u \rangle + \langle v \rangle$.

(B) $\langle u * v \rangle = \langle u \rangle + \langle v \rangle$.

Proof. Consider figure 2b. The thin lines correspond to where y-x is constant. Hence define $\sigma: \Delta^2 \to X$ by

$$\sigma(x,y) := \begin{cases} u(y-x+1) & 0 \le y \le x \le 1, \\ v(y-x) & 0 \le x \le y \le 1. \end{cases}$$

An application of the gluing lemma shows that σ is actually a singular 2-simplex. Moreover

$$\partial \sigma = u * v - v + \overline{u}.$$

Hence lemma 3.4 yield

$$0 = \langle u * v - v + \overline{u} \rangle = \langle u * v \rangle - \langle v \rangle - \langle u \rangle.$$

Corollary 3.2. *h* is a morphism of groups.

Corollary 3.3. Let u, v, w be composable paths in X. Then $\langle (u * v) * w \rangle = \langle u * (v * w) \rangle$.

Lemma 3.6. h is surjective.

Proof. Let $x \in X$. If x = p, define $\gamma_p := c_p$. If $x \neq p$, by the path connectedness of X we can choose a path γ_x from p to x. Hence we get a map $\gamma : X \to \mathsf{Top}(\Delta^1, X)$. Extending by linearity yields a mapping $\gamma : C_0(X) \to C_1(X)$. Let $c := \sum_{k=1}^n m_k \sigma_k$ be a 1-cycle in X. Consider

$$[u] := \left[\gamma_{\sigma_1(0)} * \sigma_1 * \overline{\gamma_{\sigma_1(1)}}\right]^{m_1} \cdots \left[\gamma_{\sigma_n(0)} * \sigma_n * \overline{\gamma_{\sigma_n(1)}}\right]^{m_n} \in \pi_1(X, p).$$

Now lemma 3.4 and 3.5, corollary 3.2 and 3.3 yields

$$h([u]) = \sum_{k=1}^{n} m_k \langle \gamma_{\sigma_k(0)} * \sigma_k * \overline{\gamma_{\sigma_k(1)}} \rangle$$
$$= \sum_{k=1}^{n} m_k \left(\langle \gamma_{\sigma_k(0)} \rangle + \langle \sigma_k \rangle + \langle \overline{\gamma_{\sigma_k(1)}} \rangle \right)$$

$$= \sum_{k=1}^{n} m_k \left(\langle \gamma_{\sigma_k(0)} \rangle + \langle \sigma_k \rangle - \langle \gamma_{\sigma_k(1)} \rangle \right)$$

$$= \langle c \rangle - \sum_{k=1}^{n} m_k \langle \gamma_{\sigma_k(1) - \sigma_k(0)} \rangle$$

$$= \langle c \rangle - \sum_{k=1}^{n} m_k \langle \gamma_{\partial \sigma_k} \rangle$$

$$= \langle c \rangle - \langle \gamma_{\partial c} \rangle$$

$$= \langle c \rangle.$$

Lastly, we want to show that $\ker h = [\pi_1(X, p), \pi_1(X, p)]$. Since then the first isomorphism theorem implies $\operatorname{Ab}(\pi_1(X, p)) \cong H_1(X)$. Since $H_1(X)$ is abelian, clearly $[\pi_1(X, p), \pi_1(X, p)] \subseteq \ker h$ and thus h factors uniquely $\widetilde{h} : \operatorname{Ab}(\pi_1(X, p)) \to H_1(X)$. The next lemma will be useful.

Lemma 3.7. Let $\sigma: \Delta^2 \to X$ be a singular 2-simplex. Define $\sigma^{(k)} := \sigma \circ \varphi_k^2$ for k = 0, 1, 2. Then $\sigma^{(0)} * \overline{\sigma^{(1)}} * \sigma^{(2)}$ is nullhomotopic relative to ∂I .

Let $\sigma \in \text{Top}(\Delta^1, X)$. Define $g(x) := [[\gamma_{\sigma(0)} * \sigma * \overline{\gamma_{\sigma(1)}}]] \in \text{Ab}(\pi_1(X, p))$. Extension by linearity yields a map $g : C_1(X) \to \text{Ab}(\pi_1(X, p))$.

Lemma 3.8. g vanishes on im ∂_2 .

Proof.
